# Frequency regulation and peak load regulation of energy storage grid

## Overview

---

Can a grid energy storage device perform peak shaving and frequency regulation?

This study assesses the ability of a grid energy storage device to perform both peak shaving and frequency regulation. It presents a grid energy storage model using a modelled VRFB storage device and develops a controller to provide a net power output, enabling the system to continuously perform these functions.

Can large-scale battery energy storage systems participate in system frequency regulation?

In the end, a control framework for large-scale battery energy storage systems jointly with thermal power units to participate in system frequency regulation is constructed, and the proposed frequency regulation strategy is studied and analyzed in the EPRI-36 node model.

What is frequency regulation and Net Load regulation?

Frequency regulation is implemented according to classical droop control (where  $\Delta f = f_0 - f$ , being  $f_0$  the nominal frequency of the power system). Net load regulation, on the other hand, aims to keep the net load of the micro distribution grid between 100 kW and 400 kW. These are frequency regulation and net load regulation.

Does battery energy storage participate in system frequency regulation?

Since the battery energy storage does not participate in the system frequency regulation directly, the task of frequency regulation of conventional thermal power units is aggravated, which weakens the ability of system frequency regulation.

Is there a fast frequency regulation strategy for battery energy storage?

The fuzzy theory approach was used to study the frequency regulation

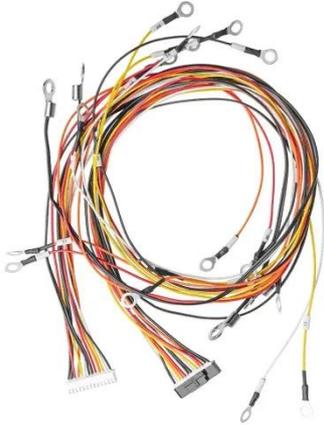

strategy of battery energy storage in the literature , and an economic efficiency model for frequency regulation of battery energy storage was also established. Literature proposes a method for fast frequency regulation of battery based on the amplitude phase-locked loop.

Are battery frequency regulation strategies effective?

The results of the study show that the proposed battery frequency regulation control strategies can quickly respond to system frequency changes at the beginning of grid system frequency fluctuations, which improves the stability of the new power system frequency including battery energy storage.
