

## SolarInnovate Energy Solutions

# Ventilation device inside the battery cabinet

## Overview

---

Energy recovery ventilators (ERVs) using an enthalpy core have proven effective for ventilating battery rooms. Before deciding on a solution, consider the relevant standards and local codes. Can a battery room be ventilated?

Because the released gases can endanger the health, they must be fed away. DIN VDE 0510 Part 2 Section 9.4.3 describes the ventilation and breathing requirements for battery rooms. natural ventilation is permitted for lead batteries of maximum 3 kW charging capacity and for NiCd batteries of maximum 2 kW charging capacity.

Do case buildings need ventilation in a battery room?

The fire safety design concepts for the case buildings give few requirements for ventilation of the battery room. Hence, the factors that underlie the design of the ventilation solutions and strategies in the battery rooms remain unclear. It is therefore difficult to identify a common or best practice based on the survey of these case buildings.

How does a battery room ventilation system work?

The battery room has a separate ventilation system, see Figure 7, Figure 8, and Figure 9. During normal operation, ventilation fans draw air from the ventilated parking garage to ensure sufficient air exchange in the battery compartment for cooling purpose. The fans are equipped with fire dampers connected to the fire alarm system.

Do stationary battery installations need ventilation?

Ventilation of stationary battery installations is critical to improving battery life while reducing the hazards associated with hydrogen production. This guide describes battery operating modes and the hazards associated with each. It provides the HVAC designer with the information to provide a cost effective ventilation solution.

Why do batteries need to be ventilated?

The battery rooms must be adequately ventilated to prohibit the build-up of hydrogen gas. During normal operations, off gassing of the batteries is relatively small. However, the concern is elevated during times of heavy recharge or the batteries, which occur immediately following a rapid and deep discharge of the battery.

What are the ventilation requirements for a battery room?

DIN VDE 0510 Part 2 Section 9.4.3 describes the ventilation and breathing requirements for battery rooms. natural ventilation is permitted for lead batteries of maximum 3 kW charging capacity and for NiCd batteries of maximum 2 kW charging capacity. In addition, artificial (technical) ventilation must be provided.
